PCU2 Firmware Updating Instructions

You will need:

• A Macintosh computer running OS X 10.6 or later with at least one free USB port
• A USB2 A-B cable

Instructions:

• Download the latest PCU firmware installer
• Decompress the .zip file by double clicking it in the finder
• Connect the PCU2 to the Mac with the USB cable.

• Power on the PCU2.
• Open the folder called vXXX (where XXX is the current firmware build) and double-click the file called "loadpcufirmware.command". A Terminal window should open and several commands should execute. After about a minute, you should see "[Process completed]" in the Terminal window, and the PCU2 will reboot. You should see the current revision number on the boot screen.

Troubleshooting:

• If the loading process completes almost instantly without showing any progress, check that the USB cable is fully seated in receptacle in the PCU2.
